

""数列极限""

考情分析

难点：“数列递推关系”题型、“方程的根”题型

关键：单调有界准则、夹逼定理

海涅定理（归结原则）

计算时正向使用，反向难以操作

具体数列“n”直接当“x”使用（抓大放小、等价无穷小、泰勒展开等等均可用）

$$\begin{aligned} & f(x) \text{在} \dot{U}(x_0) \text{内有定义} \\ \lim_{x \rightarrow x_0} f(x) = A & \Leftrightarrow \text{对任意以} x_0 \text{为极限的数列} \{x_n\} \ (x_n \neq x_0), \text{都有} \lim_{n \rightarrow \infty} f(x_n) = A \\ & f(x) \text{在} \infty \text{处有定义} \\ \lim_{x \rightarrow +\infty} f(x) = A, \infty & \Leftrightarrow \text{对任意趋于} \infty \text{的数列} \{x_n\} \ (x_n \neq x_0), \text{都有} \lim_{n \rightarrow \infty} f(x_n) = A, \infty \\ \lim_{x \rightarrow +\infty} f(x) = A & \Rightarrow \lim_{n \rightarrow \infty} f(n) = A \\ \lim_{x \rightarrow +\infty} f(x) = A & \nRightarrow \lim_{n \rightarrow \infty} f(n) = A \end{aligned}$$

无穷大的比较

$$\begin{aligned} & n \rightarrow \infty \text{时} \\ \log_a n & \ll n^\alpha (\alpha > 0) \ll a^n (a > 1) \ll n! \ll n^n \\ \text{注: } \lim_{n \rightarrow \infty} \frac{2^n \cdot n!}{n^n} &= 0; \quad \lim_{n \rightarrow \infty} \frac{2^n \cdot n! \cdot n^9}{n^n} = 0; \quad \lim_{n \rightarrow \infty} \frac{3^n \cdot n!}{n^n} = \infty \end{aligned}$$

数列极限定义注意

1. 数列极限的间断性

$$(n \in \mathbb{Z}^+)$$

2. 数列极限的单边性

$$(n \in \mathbb{Z}^+)$$

单调有界准则“两条件”判断顺序

先判上下界，再判单调性（单调性判断多数情况依赖上下界，上下界依赖单调性较少）

注：无需严格单调

数列递推关系处理（不等式）

上下界：

$$\begin{aligned} x_{n+1} &= \sqrt{x_n(4-x_n)} \Rightarrow \\ x_{n+1} &= \sqrt{x_n(4-x_n)} \leq \frac{x_n + 4 - x_n}{2} = 2 \end{aligned}$$

单调性：

$$\text{构造 } \frac{x_n \cdot (1 - x_n) \cdot x_{n+1}}{x_n} > \frac{1}{4} \Rightarrow \frac{x_{n+1}}{x_n} > \frac{1}{4x_n \cdot (1 - x_n)} \geq \frac{1}{4\left(\frac{x_n + (1 - x_n)}{2}\right)^2} = 1$$

$$x_{n+1} + \frac{1}{x_n} < 2 \Rightarrow \sqrt{\frac{x_{n+1}}{x_n}} \leq \frac{x_{n+1} + \frac{1}{x_n}}{2} < 1$$

$$x_{n+1} = \sin x_n \Rightarrow \frac{x_{n+1}}{x_n} < 1, |x_n| \leq 1$$

$$\left\{ \begin{array}{l} \cos x_{n+1} - x_{n+1} = \cos x_n (0 < x_n < \frac{\pi}{2}) \Rightarrow \\ \cos x_{n+1} - \cos x_n = x_{n+1} \Rightarrow \dots\dots \\ e^{x_n} - x_n = e^{x_{n+1}} (x_n > 0) \Rightarrow \\ e^{x_n} - e^{x_{n+1}} = x_n \Rightarrow \dots\dots \\ \cos a_n - a_n = \cos b_n, \lim_{n \rightarrow \infty} b_n = 0 (0 < a_n, b_n < \frac{\pi}{2}) \Rightarrow \\ \cos a_n - \cos b_n = a_n \Rightarrow 0 < a_n < b_n \Rightarrow \dots\dots \end{array} \right.$$

拉格朗日中值定理:

$$x_{n+1} = \ln\left(\frac{e^{x_n} - 1}{x_n}\right) \Rightarrow e^{x_{n+1}} = \frac{e^{x_n} - 1}{x_n} = \frac{e^{x_n} - e^0}{x_n - 0} = e^{\xi_n} (0 < \xi_n < x_n)$$

数列递推式bug法（典型题型）

$$x_1 = \sqrt{2}, x_{n+1} = \sqrt{2 + x_n}, \dots$$

单调有界准则证明

1. 假设极限存在为A, 解A

2. 归纳法证上下界A

$$\text{设 } x_k < 2, x_{k+1} = \sqrt{2 + x_k} < 2$$

3. 归纳法证单调性

$$\text{设 } \frac{x_{k+1}}{x_k} > 1, \frac{x_{k+2}}{x_{k+1}} = \frac{\sqrt{2 + x_{k+1}}}{\sqrt{2 + x_k}} > 1$$

重要方法: [压缩映射原理](#)

利用函数单调性判断数列单调性

适用于单调函数

$$x_{n+1} = f(x_n), \text{取 } f(x) \\ f'(x) > 0, \text{且 } a_2 > a_1 \Rightarrow \{x_n\} \nearrow \\ f'(x) > 0, \text{且 } a_2 < a_1 \Rightarrow \{x_n\} \searrow$$

结论证明:

$$x_{n+1} - x_n = f(x_n) - f(x_{n-1}) = f'(\xi_1)(x_n - x_{n-1}) = \dots = f'(\xi_1)f'(\xi_2) \dots f'(\xi_{n-1})(x_2 - x_1)$$

函数单调性判断数列单调性图像分析

由 $x_{n+1} = f(x_n)$ 型单增递推式变化规律可知 (见下图), x_n 极限只可能等于 $x = f(x)$ 交点

$f'(x) < 0, \{x_n\}$ 不单调, 振荡

即使 $f(x)$ 不单调, $\{x_n\}$ 也可能单调 (数列值域只落在 $f(x)$ 单调区间内)

$\{x_n\}$ 增减性与 $f(x)$ 的关系

递归处理技巧

★★ 重要情形:

$$x_{n+1} = f(x_n), |f'(x)| < 1$$

$$\text{令 } A = f(A)$$

$$n \rightarrow \infty \text{ 时, } |x_n - A| = |f(x_{n-1}) - f(A)| = |f'(\xi_1)| |x_{n-1} - A| = \cdots = |f'(\xi_1) \cdots f'(\xi_{n-1})| |x_1 - A| \rightarrow 0$$

$$n \rightarrow \infty \text{ 时, } |x_{n+1} - x_n| = |f'(\xi_1)| |x_n - x_{n-1}| = \cdots = |f'(\xi_1) \cdots f'(\xi_{n-1})| |x_2 - x_1| \rightarrow 0$$

连续放缩法

根据极限构造不等式

$$\lim_{n \rightarrow \infty} x_n = c \rightarrow |x_n - c| \quad (\text{若 } x_n - c > 0, \text{ 可去绝对值})$$

$$|x_n - c| \leq \frac{3}{4} |x_{n-1} - c| \leq \cdots \leq \left(\frac{3}{4}\right)^{n-1} |x_1 - c|$$

$$\frac{y_{n+1}}{x_{n+1}} = \frac{y_n^2}{\sin x_n} < \frac{\pi}{4} \frac{y_n}{x_n} < \cdots < \left(\frac{\pi}{4}\right)^{n-1} \frac{y_1}{x_1}$$

数列计算常用结论

$$\lim_{n \rightarrow \infty} \sqrt[n]{n} = 1, \lim_{n \rightarrow \infty} \sqrt[n]{a} = 1, \lim_{n \rightarrow \infty} \sqrt[n]{\frac{1}{n}} = 1$$

灵活拆分, 根号下为有限项多项式、有限项多项式的倒数、 $(n, \frac{1}{n})$ 的有限项多项式也成立

$$\lim_{n \rightarrow \infty} \sqrt[n]{a_1^n + a_2^n + \cdots + a_k^n} = \max\{a_1, a_2, \cdots, a_k\} = a^*$$

$$a^* = \sqrt[n]{a^{*n}} \leq \sqrt[n]{a_1^n + a_2^n + \cdots + a_k^n} \leq \sqrt[n]{na^{*n}} = a^*$$

注: 数列极限 $\lim_{n \rightarrow \infty} (\Delta)^{\frac{1}{n}}$ 问题: 首先考虑放缩法

数列敛散性结论

$$\lim_{n \rightarrow \infty} x_n = a \Leftrightarrow \lim_{n \rightarrow \infty} x_{2n} = \lim_{n \rightarrow \infty} x_{2n+1} = a \quad (\text{高维同理})$$

$$\lim_{n \rightarrow \infty} x_n \not\Rightarrow \lim_{n \rightarrow \infty} (x_{n+1} - x_n) = 0 \quad (\text{反例: } x_n = \sum_{k=1}^n \frac{1}{k})$$

$$\lim_{n \rightarrow \infty} \{x_n - y_n\} = 0 \not\Rightarrow \lim_{n \rightarrow \infty} \frac{x_n}{y_n} = 1 \quad (\text{反例: } x_n = \frac{1}{n^2} + \frac{1}{n}, y_n = \frac{1}{n^2})$$

$$\begin{aligned} & \neq \quad (\text{反例: } x_n = n(n+1), y_n = n^2) \\ \lim_{n \rightarrow \infty} (x_{n+1} - x_n) = 0 & \not\Rightarrow \lim_{n \rightarrow \infty} \frac{x_{n+1}}{x_n} = 1 \quad (\lim_{n \rightarrow \infty} x_n \neq 0 \text{ 时成立, 反例: } x_n = \frac{1}{n!}) \\ & \neq \quad (\text{反例: } x_n = n) \\ \lim_{n \rightarrow \infty} x_n = a & \Rightarrow \lim_{n \rightarrow \infty} |x_n| = |a| \quad (a \neq 0) \\ \lim_{n \rightarrow \infty} x_n = 0 & \Leftrightarrow \lim_{n \rightarrow \infty} |x_n| = 0 \end{aligned}$$

三项递推式

构造两两相邻项之间的递推关系

求和型（等差）：

$$\begin{aligned} x_{n+2} &= 2x_{n+1} - x_n \\ \Rightarrow x_{n+2} - x_{n+1} &= x_{n+1} - x_n \quad (\text{同侧系数须化一致, 否则无法求和}) \end{aligned}$$

递推型：

- ①逐层向下得两两递推： $x_{n+2} - ax_{n+1} = a(x_{n+1} - ax_n) = \cdots = a^n(x_2 - ax_1) = a^n b$
 ②两两递推向下的通式： $x_{n+2} = a^n b + ax_{n+1} = a^n b + a(a^{n-1}b + ax_n) = \cdots = (n+1)a^n b + a^{n+1}x_1$
 （两侧系数须化统一，否则无法向下递推）

级数求和式

1. 直接求和、有理化、裂项相消等
2. 夹逼准则（放缩）：无法求和极限，用放缩法夹逼求和
3. 单调有界准则：判单调性、放缩看上界、下界
4. 积分定义式：注意“n”对应，注意整理变形

$$\begin{aligned} \lim_{n \rightarrow \infty} \sum_{i=1}^n f\left[a + \frac{(b-a)i}{n}\right] \frac{b-a}{n} &= \int_a^b f(x) dx \\ \lim_{n \rightarrow \infty} \frac{1}{n} \left(\frac{\sqrt{n^2-1^2}}{n} + \frac{\sqrt{n^2-2^2}}{n} + \cdots + \frac{\sqrt{n^2-n^2}}{n} \right) &\Rightarrow f(x) = \sqrt{1-x^2} \\ \lim_{n \rightarrow \infty} \sqrt[n]{\left(1 + \frac{1}{n}\right)^2 \left(1 + \frac{2}{n}\right)^2 \cdots \left(1 + \frac{n}{n}\right)^2} &\xrightarrow{\text{指数化}} f(x) = \ln(1+x)^2 \end{aligned}$$

构造导数定义

$$\begin{aligned} f(0) = 0, f'(0) = 1, \text{求 } \lim_{n \rightarrow \infty} \left[f\left(\frac{1}{n^2}\right) + f\left(\frac{2}{n^2}\right) + \cdots + f\left(\frac{n}{n^2}\right) \right] \\ \lim_{n \rightarrow \infty} \left[\frac{f\left(\frac{1}{n^2}\right) - f(0)}{\left(\frac{1}{n^2}\right)} \cdot \frac{1}{n^2} + \frac{f\left(\frac{2}{n^2}\right) - f(0)}{\left(\frac{2}{n^2}\right)} \cdot \frac{2}{n^2} + \cdots + \frac{f\left(\frac{n}{n^2}\right) - f(0)}{\left(\frac{n}{n^2}\right)} \cdot \frac{n}{n^2} \right] \\ \lim_{n \rightarrow \infty} \left[\frac{1}{n^2} + \frac{2}{n^2} + \cdots + \frac{n}{n^2} \right] \end{aligned}$$

极限凑“q<1”技巧

$$0 < a_1 < a_2, \lim_{n \rightarrow \infty} (a_1^{-n} + a_2^{-n})^{\frac{1}{n}}$$

$$I = \lim_{n \rightarrow \infty} a_1^{-1} \left[1 + \left(\frac{a_1}{a_2} \right)^n \right]^{\frac{1}{n}} = a_1^{-1}$$

$$x_n = (1+a)^n + (1-a)^n, \text{证: } \lim_{n \rightarrow \infty} \frac{x_{n+1}}{x_n} = \begin{cases} 1+|a|, & a \neq 0 \\ 1, & a = 0 \end{cases}$$

$$a > 0 \text{ 时, } \lim_{n \rightarrow \infty} \frac{x_{n+1}}{x_n} = \lim_{n \rightarrow \infty} \frac{1 + a + \left(\frac{1-a}{1+a}\right)^n (1-a)}{1 + \left(\frac{1-a}{1+a}\right)^n} = 1 + a$$

$a < 0 \text{ 时, } \dots\dots$

压轴题型一

★★ “方程的根”类型问题

证单根：零点定理 + 单调

证根的极限（难点）：无统一特征

数列极限特例

$$x_1 = \sqrt{a} (a > 0), x_{n+1} = \sqrt{a + x_n}, \dots\dots$$

$$\{x_n\} > \sqrt{a}$$

单增：

$$x_{n+1} - x_n = \frac{x_n - x_{n-1}}{\sqrt{a + x_n} + \sqrt{a + x_{n-1}}} = \dots = \frac{x_2 - x_1}{\dots\dots} > 0$$

有上界：

$$x_{n+1}^2 = a + x_n \Rightarrow x_{n+1} = \frac{a}{x_{n+1}} + \frac{x_n}{x_{n+1}} < \sqrt{a} + 1$$
